Introduction
Diabetic retinopathy (DR) is a major micro vascular complication of diabetes. It is the most common cause of blindness in the working-age population in developed countries. Nearly 70-80% of the population with diabetes mellitus is diagnosed with metabolic syndrome (MS), which consists of central obesity, glucose intolerance, hyperinsulinemia, low high-density lipoproteins, high triglycerides and hypertension. MS clearly associated with macro vascular complications, but its association with micro vascular disease as retinopathy is unclear. Dyslipidemia, a major systemic disorder, is one of the most important risk factors for cardiovascular disease. Patients with diabetes have an increased risk of suffering from dyslipidemia concurrently. High serum lipid levels have also been proposed as a risk factor for DR. Large clinical studies showed a discrepancy about the association of serum lipids with the severity of DR or diabetic macular edema (DME). In ETDRS report, high total cholesterol and LDL levels were associated with retinal hard exudates; in the Chennai Urban Rural Epidemiology Study, serum lipids were higher in patients with DR than those without DR. On the other hand, those findings were not confirmed by other large studies such as Multi-Ethnic Study of Atherosclerosis and the Australian Diabetes, Obesity, and Lifestyle Study. Furthermore, in Singapore Malay Eye study, it was reported that higher cholesterol levels were protective of any retinopathy. Despite intensive study of this problem, up to now it has not been established whether dyslipidemia is the cause of diabetic retinopathy in patients suffering from diabetes mellitus type 2 with metabolic syndrome.

Aim: To investigate the relationship between triglycerides and diabetic retinopathy (DR) at patients with diabetes mellitus type 2 (DM2) in metabolic syndrome (MS).

Methods: 115 patients with DM2 in presence of MS (Group 1) and 45 patients with DM2 in absence of MS (Group 2) were included into investigation. In all cases age and duration of DM2 were registered. Total cholesterol (TCh), HDL-cholesterol (HDL), triglycerides (TG) levels were measured. Definition of MS was based on WHO recommendations. Eyes examination included vision acuity, tonometry, biomicroscopy, ophthalmoscopy and fluorescein angiography. 42 patients of Group 1 and 17 patients of Group 2 had different forms of DR.

Results and discussion: Data on age, duration, total cholesterol, HDL-cholesterol, triglycerides in two groups are shown in Table 1.

Table 1 The characteristics of study groups

<table>

<tbody>
<tr>
<td>The age of patients</td>
<td>53.6±8.37 years</td>
<td>47.5±8.36 years</td>
<td>p&lt;0.05</td>
</tr>
<tr>
<td>Duration of DM2</td>
<td>6.0±6.08 years</td>
<td>5.6±4.69 years</td>
<td>p&gt;0.05</td>
</tr>
<tr>
<td>Total cholesterol</td>
<td>221.3±75.00 mg/dl vs 205.6±57.46 mg/dl</td>
<td>p&gt;0.05</td>
<td></td>
</tr>
<tr>
<td>HDL-cholesterol</td>
<td>44.0±6.98 mg/dl</td>
<td>44.1±6.98 mg/dl</td>
<td>p&gt;0.05</td>
</tr>
<tr>
<td>Triglycerides</td>
<td>248.2±151.23 mg/dl vs 221.8±114.94 mg/dl</td>
<td>p&gt;0.05</td>
<td></td>
</tr>
</tbody>
</table>

The age of patients was higher in Group 1, than in Group 2 (53.6±8.37 years vs 47.5±8.36 years; p<0.05). There was no statistical difference in Group 1 and Group 2 (in all cases p>0.05) between duration of DM 2 (6.0±6.08 years vs 5.6±4.69 years respectively), TCh (221.3±75.00 mg/dl vs 205.6±57.46 mg/dl respectively), HDL (44.0±6.98 mg/dl vs 44.1±6.98 mg/dl respectively), TG (248.2±151.23 mg/dl vs 221.8±114.94 mg/dl respectively). There was a significant correlation between prevalence of DR and levels of TG in Group 2 (r=0.18; p<0.05), but not the same in Group 2 (r=0.18; p>0.05).

Conclusion
Improvements in diabetes care and management are crucial to decrease the incidence and severity of DR. Nevertheless, DR remains the most common cause of legal blindness in adults in developed countries. TG involves into the process of DR development at patients with MS, but not at patients suffering from diabetes mellitus type 2 without MS and points out the importance of TG as a risk factor of diabetic retinopathy at patients suffering from DM 2 with MS. The study showed the different pathogenesis mechanisms in development of DR in patients with and without metabolic syndrome. In our study, we found out a significant correlation between prevalence of DR...
and levels of TG in patients with metabolic syndrome, but there was no association prevalence of DR and levels of TG in patients with metabolic syndrome at patients suffering from diabetes mellitus type 2 without MS. The lack of association of lipid profile with severity of DR in this study is compatible with previous data from the Multi-Ethnic Study of Atherosclerosis, which show no association between serum lipids and DR and the Australian Diabetes, Obesity, and Lifestyle Study. 10–12

Similarly, Ebeling and Koivisto reported that duration, age, and triglyceride level explained nearly half of the variation in the severity of retinopathy. 13 Significant associations between DR and total cholesterol were protective of any retinopathy. 14

On the contrary, in the Chennai Urban Rural Epidemiology Study, Rema et al 20 reported that mean cholesterol, triglyceride and non-HDL levels were higher in patients with DR compared to those without DR. However, only triglycerides were independently associated with. 16 Similarly, Ebeling and Koivisto reported that duration, age, and triglyceride level explained nearly half of the variation in the severity of retinopathy. 17 Significant associations between DR and total cholesterol was found in patients in Sweden. 18

In conclusion, we found out a significant correlation between prevalence of DR and levels of TG in patients with metabolic syndrome however, there was no significant association at patients suffering from diabetes mellitus type 2 without MS. The large multicentric prospective studies are needed about this subject, especially to explain the effect of the lipids levels on the development and progression diabetic retinopathy in patients with metabolic syndrome deeply.
